

NOCT

Aspirin has stood the test of many centuries

and is still used today. In fact, it's been used for over 2,400 years.

Today, ongoing studies follow aspirin's potential for cancer prevention.

For example, a study of 136,000 men found that taking aspirin daily reduced the risk of colorectal cancer by 40% (JAMA 2016).

Another study of 610 women found that taking aspirin daily reduced the risk of breast cancer by 35% and the risk of colorectal cancer by 40% (JAMA 2014).

Aspirin also reduces the risk of heart disease by 50% (JAMA 2012).

Aspirin isn't for everybody.

It can cause stomach bleeding and ulcers, and it can interact with other medications.

Before starting preventive aspirin therapy,

talk to your doctor.

Is It Bronchitis?

When you have bronchitis, you may have a cough and a sore throat.

Other symptoms include chest pain and a fever.

Other symptoms include a runny nose and a headache.
